

Assignment - 2

Behavioral	Data flow
describes what circuit does	Describes how data flows
always / process	continuous assignment
Easier for complex logic	Simple & concise for arithmetic
always @(*) S = A + B	assign S = A + B

(2) concurrent Assignment vs Process

concurrent assignment: Executes continuously

: assign $y = A \& B$

Process statement: Executes when signal in list changes

: always (*) $y = A \& B$

(3) Switchable Style for LAO

Behavioral modeling

Reason:

Easy to describe
less code

Easy to modify

Synthesis tools optimize the
design automatically.

(5) 8 bit shift register

always, @ (posedge clk)

begin

for (i = 7; i > 0; i = i - 1)

q[i] = q[i - 1];

q[0] = serial_in;

end.
